

Tree radar investigations

D F Clark Bionomique Ltd have purchased a Tree Radar Unit™ (TRU™). This equipment scans the ground for roots and tree stems to assess tree condition in a quick and non invasive way.

We believe that this equipment can help **developers**

Find out where tree roots are to -

- Clearly show the actual rooting area to guide the construction layout
- Demonstrate the presence or absence of tree roots in planning and legal disputes
- Provide absolute evidence for planning applications, inquiries and to find a technical solution to bespoke construction issues

Find out about tree condition by -

- Scanning trunks for defects
- Scanning for root health

Our equipment can be used for all your normal ground penetrating radar requirements; including underground services and mammal burrows.
